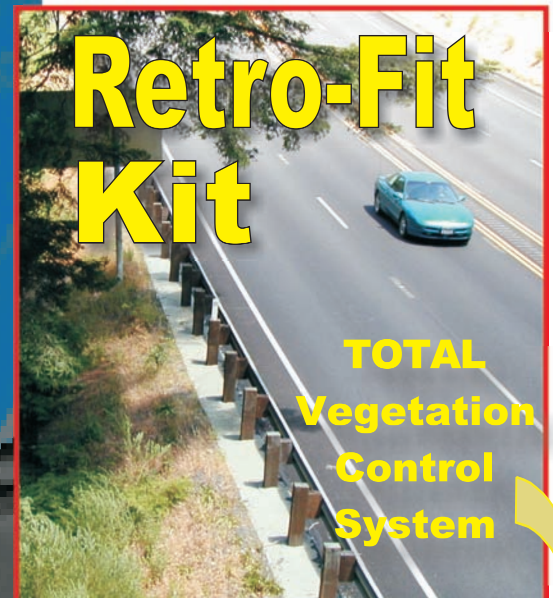
TECHNOLOGY FOR TOMORROW

Announcing !

By Popular Demand!!!

The **WeedEnder**



U-TECK TECHNOLOGY FOR TOMORROW

For Existing Guardrails

Now U-Teck's WeedEnder is available in a Retro-Fit Kit for existing guardrails.

Due to popular request, U-Teck has devised a method by which DOTs and municipalities can reap the reward of using WeedEnder without disrupting existing guardrail formation. The new Retro-Fit Kit comes complete with everything needed and simply slips into place around the posts of the in-place guardrail. WeedEnder cuts your installation costs by avoiding having to disturb the guardrail at all.

What is WeedEnder?

WeedEnder protects the environment while controlling unwanted vegetation. WeedEnder's patented construction provides for weed control without using poisons or dangerous herbicides that might seep in our water systems through normal run-off. Constructed of durable elhylenelerephalate, WeedEnder is not to be confused with other landscape fabrics. It is so rugged and strong you can drive trucks or mowers over it, but yet so flexible it has a thousand uses. And you do not have to worry about repeated visits with weedeaters!!

How does it work?

Vegetation needs three things to grow and thrive:

- Nutrients
- Water
- Sunlight

WeedEnder deprives vegetation of only one of these factors: Sunlight. Its unique construction allows water and nutrients to pass through, helping the root system in the area to get everything it requires to survive and prevent erosion.

When properly installed, WeedEnder can virtually stop the vegetation growth around and under any sign or guardrail. This then allows the mower crew to proceed by at its normal speed with no stops required. **It is truly the answer to an old problem. And get this, it keeps working for years and years.**

WeedEnder is perfect on any terrain for controlling vegetation growth under guardrails.

Simple Retro-Installation

The new WeedEnder Retro-Fit simply slides right around the existing guardrail posts. The job is complete with the addition of the joining strip and stainless steel stakes to adhere it snuggly to the ground surface. It's almost like laying carpet.

Is WeedEnder cost-effective?

WeedEnder, once properly installed, does not require repeated visits with weedEaters or sprayers. It provides a virtually ***Maintenance-Free*** area. Mowers can pass safely over the material. Unlike sod or grass, which need to be retreated year after year, once WeedEnder is properly installed, you can forget about it for years to come. You stop those yearly maintenance costs that rise with each new budget year.

How Flexible is WeedEnder?

WeedEnder is very flexible. You can work it around signs, guardrails, plants or shrubs and beautification areas. Some companies call it **Flexible Concrete**, because as tough as it is, you can roll it up if you need to reuse it. The vegetation growth receives the same protection that concrete would provide, yet the material conforms to the contour of the ground after a few short hours and then clings snugly to the ground.

.

How tough is WeedEnder?

WeedEnder is designed as a tough, non-woven material so rugged and strong you can even drive trucks over it repeatedly without damage. It is ideal for areas requiring DOT responsibility and supervision. Even in the unfortunate occurrence of an accident, this material can be reused. It is constructed of a very dense, multi-directional needling of synthetic polyester fibers and is totally impregnated with a special resin that has ultraviolet inhibitors to safeguard against deterioration. The estimated life of WeedEnder is in excess of **15 years under normal conditions.**

Slide and Place WeedEnder material under Guard Rail and around Posts from this side first.
